

# How to setup international keyboard in X Window with Xmodmap and XKB

by Juraj Sipos, [xvudpapc@savba.sk](mailto:xvudpapc@savba.sk)

v1.3, 01 December 2001

How to setup international keyboard in Linux or Unix with Xmodmap and XKB written by (c) Juraj Sipos. The Xmodmap is a file that XFree86 reads in order to give you a keyboard layout. This solution will work for you in setting up any international keyboard for (Debian, RedHat, Mandrake, CorelLinux) Linux, FreeBSD, OpenBSD, NetBSD and possibly every Unix that uses XFree86. The advantage of this howto is that it is not architecture specific and will work on all other systems. However, it is a little experimental in that that it bypasses some standardized XFree86 solutions (with respect to its older versions), although a standard form of internationalization is included too.

## 1.2. Revision history

### *Version 1.0.0*

Initial version Summer 1999

### *Version 1.1*

Added copyright information and slight modifications pertaining to newer systems

### *Version 1.2*

Completely rebuilt, added the possibility to force the system to read Xmodmap; some national Xmodmap files added, more information included on building up the standard Xmodmap files

### *Version 1.3*

Minor corrections, spell checking and editation made, few more Xmodmap files added; list of what all ISO8859\* specifications mean

### *Version 1.4*

Correction of script for including X Window fonts to StarOffice 5.2

### *Version 1.5*

December 2001, Links on internationalization added, info on XKB, troubleshooting, info on newer Linux versions, StarOffice 6

---

## 1.3. Introduction

The international keyboard Xmodmap HOWTO. Copyright (C) 1999, 2001 Juraj Sipos (xvudpapr@savba.sk). Imagine you use a Linux or a BSD OS and want to write a business letter to a person that has a foreign name with a slash or idiaresis. Danish language uses signs like ø and Spanish like ñ.

## How to setup international keyboard in X Window with Xmodmap and XKB

This is the Xmodmap Howto, but some info on XKB is included, too. With this information you can make your own international keyboard layout without installing any additional packages. The following information will help you set up German, Spanish, Italian, Slovak, Czech, Polish, Slovenian, Croatian, Danish, Dutch, French, Finnish, Norwegian, Estonian, Latvian, Swedish and other keyboards. You can also alternatively look at my homepage at <http://www.freebsd.nfo.sk> to see layouts of various keyboards. In case you want to install Greek, Hebrew or Russian language, follow my information and apply changes pertinent to these languages also with respect to other documentation (e.g., install Greek fonts, etc., see the Cyrillic, Hebrew, or Danish howto).

---

## 2. Setting up international keyboard in X Window System with Xmodmap and XKB

### 2.1. Quick start

#### 2.1.1. Xmodmap

Make your own `.Xmodmap` file according to information in this file.

Write the following to your `.bash_profile` in your home directory:

```
export LANG=language
```

where "language" is the language you want to use. The languages can be found in the file `locale.alias` in `/usr/X11R6/lib/X11/locale`. Note: some programs, like Mozilla, won't care about these user's locale settings. Run "exit" command on the console and log in again for bash to read the statement from its `.bash_profile`.

Install fonts (best are ISO8859–2 Type1 fonts for Eastern Europe, Czech or Slovak), put them in your font path in the `/etc/X11/XF86Config` file (on some newer systems this is not necessary). Start X Server. Run the command "xmodmap `/.Xmodmap`" from an X terminal window to force the system to read the `.Xmodmap` file.

---

#### 2.1.2. XKB

Provided you have your fonts installed, just open the X Terminal window and issue a command: `setxkbmap kb`, where "kb" is the keyboard layout you want to use, for example: `setxkbmap si`

for the Slovenian language

```
setxkbmap de
```

for the German language

All the language names you may use are located in `/usr/X11R6/lib/X11/xkb/symbols` directory.

If you are using KDE, open the KDE Start button, click on Preferences, Personalization, Country & Language and choose ISO8859–2 charset. Note that this may be slightly different depending on the Linux distribution.

Switch the keyboard (my xmodmap definition uses Scroll Lock for switching, other xmodmap files use Right Alt) and enjoy.

You may alternatively edit the `/etc/X11/Xf86Config` file as explained in the Danish Howto, or issue this command in an X terminal window for the Slovak keyboard:

```
setxkbmap –model pc102 –symbols 'czsk(us_sk_qwertz)' setxkbmap cs –option grp:shift_toggle
```

## How to setup international keyboard in X Window with Xmodmap and XKB

In RedHat 7.2 and Mandrake 8.1, it is enough to run the following `setxkbmap` command from an X Terminal Window (assuming you have correct fonts installed): `setxkbmap sk setxkbmap si setxkbmap de`

`qwerty` or `qwertz` means that the letter `z Z` and `y Y` are swapped.

To see a variety of language maps (symbols), look in the file `symbols.dir` in `/usr/X11R6/lib/X11/xkb` directory.

Some X Window managers override `.Xmodmap` setting. If `.Xmodmap` isn't read by X automatically after starting the X Window System, a good way is to force the system to read it from your root (home) directory. You will do this by issuing the following command from an X terminal window:

```
xmodmap /.Xmodmap
```

After I installed the Slovak keyboard in KDE with Xmodmap file that used the standard definitions for ISO8859-2 keycode entities (Icaron, scaron, etc.), I couldn't write in Slovak or Czech, so I made few changes to the Xmodmap file explained later in this file. After applying these changes, no other changes were necessary.

---

## **2.2. How to do it – this experimental or nonstandard solution is not necessary for newer versions of XFree86. Skip this if not interested**

Put the following in your `.bash_profile`:

```
export LANG=language
```

OR

OR for `cs` shell

```
setenv LANG=language
```

and have the standard Xmodmap file in your home directory. If you ask me where you may obtain such "standard" Xmodmap files, go to GNOME `../share` directory. The file `/usr/X11R6/lib/X11/locale/locale.alias` contains the aliases for languages, so look there in order to find out what is `ca_ES` or `br_FR` (the exact syntax for your language to use – you cannot write "croatia" but you must write "croatian", not "Croatian"; this is very important, as Unix is case sensitive).

Now you must install the pertinent language fonts and put `path` in `XF86Config` file to these fonts. If you want to internationalize your keyboard, use the standard Xmodmap definitions first and use `right alt` to switch between keyboards (if you use GNOME Xmodmap files). If it does not work, do the following:

a) Copy the "Compose" file from: `/usr/X11R6/lib/X11/locale/iso8859-2` to: `/usr/X11R6/lib/X11/locale/iso8859-1` directory (yes, `iso8859-1`, not `iso8859-2`). Back up the original "Compose" file if you want

## How to setup international keyboard in X Window with Xmodmap and XKB

b) Put the included .Xmodmap file to your root directory (Slovak language, or make your own .Xmodmap file, or choose from the ones listed here).

c) Install ISO8859-2 fonts (or other pertinent fonts).

You may try to issue the command:

```
xset q
```

to see which fonts are in your path.

If you want to add fonts in your path from the X Window System, issue the command:

```
xset fp+ /usr/fonts_path
```

```
xset fp rehash
```

d) Disable every "Scroll Lock" uncommented line in your XF86Config, because our .Xmodmap file for the Slovak language uses the Scroll Lock to switch between keyboards.

e) Put the appropriate fontpath for your newly installed fonts in the XF86Config file, if necessary (Mandrake 7.2 and other OS's may not require this). The Xmodmap solution may be applied to all X keyboards of your choice.

First, I must say that in my solution (in older XFree86 versions), different mapping is used for Xmodmap keycodes for some ISO8859-2 keycode entities. ISO8859-2 definitions (keycode entities) like lcaron, zcaron actually do not work. This means that the ISO8859-1 definitions must be used instead and they will either give you what they say they are (aacute [á], eacute [é], etc.), or they will not give you what they say they are (using ISO8859-2 fonts, putting "threequarters" in your .Xmodmap file will not give you "3/4" but "z" with a caron, a reversed ^ above it). For example, "mu" will give lcaron, "oslash" rcaron, etc.

However, other key definitions, for example, adieresis (a with two dots above it), uacute (u with a slash above it), as well as dead\_diaeresis do not require a substitution of other definitions and work pretty well, as they're defined everywhere (a dead key is a key you press, hold it, yet nothing happens, but after pressing another key you will get a special letter).

The original "Compose" file in ../iso8859-1 directory can be fully utilized for English, Slovak or Czech keyboard layouts (Polish, Hungarian, Slovenian, Croatian) in some older XFree86 distributions, but there is only one problem – dead keys do not work. That's why you have to copy the "Compose" file from the iso8859-2 directory to iso8859-1 directory, or alternatively, you can edit the "Compose" file in iso8859-1 directory.

You can leave the Keyboard section in your XF86Config file without much change. Put (if it's not already there) the following in the "Keyboard" section:

```
Section "Keyboard"
```

```
Protocol "Standard"
```

```
XkbRules "xfree86"
```

2.2. How to do it – this experimental or nonstandard solution is not necessary for newer versions of XFree86

## How to setup international keyboard in X Window with Xmodmap and XKB

```
XkbModel "pc101"
```

```
XkbLayout "us"
```

Force the system to read the xmodmap map by issuing the command: "xmodmap /.Xmodmap".

Alternatively, you can have 60 .Xmodmap files like .Xmo1, .Xmo2, .Xmo3, .Xmo4, etc., and you may force the system to read them (xmodmap /.Xmo1). The dot means it is a hidden file and it is not necessary. You may also have xmo1, xmo2, or xmo3 Xmodmap files.

StarOffice 6.0 handles well conversion to win1250 and vice versa, so you can transport documents to a MS platform. In my Mandrake 8.0, StarOffice 6.0 was internationalized immediately after using my standard Xmodmap solution. All the fonts worked. However, with StarOffice 5.2 this is not the case. In StarOffice 5.2, you must add X fonts to StarOffice's fonts directory. Here is a script that will do it for you. Cut it, name it "so52", make it executable (chmod +x so52), copy it to the StarOffice5.2/share/xp3 directory and execute it there.

```
-----cut_here-----
```

```
#!/bin/sh
```

```
# Put path to your StarOffice here
```

```
STAR_OFFICE_ROOT=/mnt/StarOffice5.2
```

```
FONTSDIR=/usr/X11R6/lib/X11/fonts/ISO8859-2/Type1
```

```
# -----
```

```
# Don't edit the script here
```

```
# -----
```

```
XP3_DIR=$STAR_OFFICE_ROOT/share/xp3
```

```
if [ -e $XP3_DIR/psstd.fonts.il2 ]; then
```

```
echo "Changes were already done!"
```

```
echo "If there's a problem, delete the file"
```

```
echo " $XP3_DIR/psstd.fonts.il2"
```

```
exit 1
```

```
fi
```

```
if [ -e $FONTSDIR/afm ]; then
```

```
AFM_DIR=$FONTSDIR/afm
```

```
else
```

2.2. How to do it – this experimental or nonstandard solution is not necessary for newer versions of XFree86

```
AFM_DIR=$FONTS_DIR

fi

# Link AFM files.

ln -sf $AFM_DIR/*. [aA][fF][mM] $XP3_DIR/fontmetrics/afm

# Link PFB files.

ln -sf $FONTS_DIR/*. [pP][fF][bB] $XP3_DIR/psoftfonts

grep "\.pfb" $FONTS_DIR/fonts.dir \

| sed -e 's/\.pfb /, /g' -e 's/-0-0-0-0-/-%d-%d-%d-%d-/g' \

> $XP3_DIR/psstd.fonts.il2

cat $XP3_DIR/psstd.fonts.il2 >> $XP3_DIR/psstd.fonts
```

-----cut\_here-----

StarOffice 5.2 fully recognizes Word97 documents even written in other languages, but a converter from iso8859-2 to win1250 encoding is necessary in order to transport ISO8859-2 documents to M\$ platform. For html documents this is not necessary.

StarOffice 5.2 can be thus used by professional translators

---

## 2.3. Xmodmap theory and standard Xmodmap solution

If you want to edit and make your own .Xmodmap keyboard layout definitions, I'll explain one line of the .Xmodmap file to make clear what you should do.

This explanation can be used for all keycodes. For example, the line:

```
keycode 0x11 = 8 asterisk acute 8
```

(note: keycode 0x11 is derived from the "xkeycaps" utility; you can also use the X Window "xev" utility to explore keyboard puzzles.)

says that the first pair, the default one, (number "8" and "asterisk") will display number "8" when you press keycode 0x11 ("8"), will display asterisk when a "shift" key is pressed. After pressing the Scroll Lock, there's another definition: ISO\_NEXT\_GROUP, which means that when you press the default "8" key, no "8" will be displayed, but acute ("á"); when you press the "shift" key, number "8" will be displayed. So if you change "acute" and "8", anything you put instead of "acute" and "8" will be displayed, for example:

```
keycode 0x11 = 8 asterisk semicolon colon
```

will give you "semicolon" and "colon" in your 0x11 keycode after pressing the Scroll Lock.

The ISO\_NEXT\_GROUP is defined by another line. If this line is not defined, you will be able to use only two definitions ("8" and "asterisk") – look at my .Xmodmap file. If you delete the ISO\_NEXT\_GROUP (the next pair of definitions on the right), you will have only one group of keyboard definitions ("8" and "asterisk"). Be careful when editing the .Xmodmap file. You mustn't delete definitions that enable utilization of the Scroll Lock unless you know what you are doing (or you map the second keyboard by right Alt). These are the lines such as:

```
keycode 0x4e = ISO_Next_Group
```

```
add mod5 = ISO_Next_Group,
```

etc. You must also keep in mind that Unixes are case sensitive. If you want to find out more about keycodes, install the package "xkeycaps" or use "xev".

---

## 2.4. Experimental .Xmodmap sample file for the Slovak language typewriter layout

You may find almost any xmodmap file in the GNOME directory in (SuSE) /opt/gnome/share/xmodmap (with standard ISO8859-1,2 and other definitions). To switch between the keyboards, use right Alt.

---

## 2.5. Character sets

The purpose of the following info is to help you build any .Xmodmap keyboard layout with ISO8859-2 or other fonts. The ISO8859-2 Character Set file is included here for you to know which names are used for pertinent keys. You should not bother about the numbers, but notice how keys are named. Much of this information is useful to build a keyboard with ISO8859-1 characters only, or a combination of East European characters and Western characters. If you're going to use other languages than the Central European or Western European ones, find a pertinent table for your ISO\*\*\* character set on Internet. The gdkkeysyms.h file, that contains all the crazy names for keycode entities including hexcodes, is in (older versions of RedHat) /usr/include/gdk/ directory. If no gdkkeysyms.h file is on your system, see the file /usr/X11R6/include/X11/keysymdef.h, or try to look in /lib/perl5/site\_perl/5.6.0/i386-linux/GTK/keysyms.pm (it also contains names of keycode entities including hex codes). If you have a newer version of PERL, the "5.6.0" may differ. The similar should apply to other systems (FreeBSD), as all these use PERL.

---

First, if you are using older systems, try to see if standard definitions will give you (after installing pertinent fonts and building Xmodmap with keyboard definitions for X) what they say they are. If they will not give you what they say they are (some keycodes will be unfunctional), then put to your bash\_profile the "export LANG=language" statement and if you are still unsuccessful, you must make a substitution. Definitions which will not give you what they say they are can be traced by their visual shape in Western Latin 1 encoding. If you are a Czech, for example, you may issue a command:

```
setxkbmap -model pc102 -symbols 'czsk(us_cz_qwertz)' setxkbmap cs -option grp:shift_toggle
```

and see what will give you an X terminal window (press both Shift keys or press alt and hold it to see the other keyboard layout). This means that by pressing a letter "3" you will get a real "onesuperior" key. It is good that X terminal window does not make use of ISO8859-2 fonts now, so you will see what you must use instead of scaron (scaron = onesuperior). By putting "onesuperior" in an .Xmodmap file you will get a REAL "scaron", but obviously, only with use of ISO8859-2 fonts (with use of ISO8859-1 fonts, you will get a REAL "onesuperior").

Thus, the X Terminal window will show you fonts like micron, onesuperior, threequarters, and so on. You will see what you must substitute. But if you don't know what "?" is called in the ISO terminology, find and download an appropriate character set table for ISO8859-1, or look in gdkkeysyms.h file, /lib/perl5/site\_perl/5.6.0/i386-linux/GTK/keysyms.pm file, or ../ISO8859-1/Compose file. Alternatively, you may experiment with all codes defined in /usr/X11R6/lib/X11/locale/ISO8859-1/Compose file. You must use the ISO8859-1 entities when the system refuses to display the ISO8859-2 entities correctly.

The following symbols on your right is what I found out through my research. This is just an example. When you use a "Pound" definition in the Xmodmap file, the X Window System will display you a Lslash instead (in relation to using iso8859-2 fonts, of course). When you choose some easy KDE text editor, select iso8859-2 fonts charset from the fonts menu. NOTE: vowel \*acute (uacute, eacute, etc.) signs require no substitution, therefore I omitted iacute, aacute, etc., here.

ISO8859-1 entity will give you the: ISO8859-2 entity

## 2.7. The standard ISO8859–2 definitions in the Xmodmap file

The example of a Standard .Xmodmap file. Use this file if X Server correctly displays lcaron, scaron, etc., in newer versions of XFree86.

! This is an `xmodmap' input file for PC 101 key #2 (Linux/FreeBSD/XFree86; US/sk)

! keyboards created by XKeyCaps, modified by Juraj Sipos on 8/17/1999.

! XKeyCaps 2.38 is Copyright (c) 1997 Jamie Zawinski (jwz@netscape.com).

! <http://people.netscape.com/jwz/xkeycaps/> This is an .Xmodmap solution for

! Slovak keyboard in FreeBSD. You must have ISO–8859–2 fonts installed with a

! pointer in /etc/XF86Config, for example,

! FontPath "/usr/X11R6/lib/X11/fonts/ISO8859–2/Type1". The section "Keyboard"

! in XF86Config must contain at least the following line. You don't have to

! specify any special XkbLayout.

! Section "Keyboard"

! Protocol "Standard"

## How to setup international keyboard in X Window with Xmodmap and XKB

! XkbRules "xfree86"

! XkbModel "pc101"

! XkbLayout "us"!

! The Slovak/English keyboard is switched to by Scroll Lock

! This file makes the following changes:

!

! The "F1" key generates F1 and F11

! The "F2" key generates F2 and F12

! The "F3" key generates F3 and F13

! The "F4" key generates F4 and F14

! The "F5" key generates F5 and F15

! The "F6" key generates F6 and F16

! The "F7" key generates F7, F17, and dead\_circumflex

! The "F8" key generates F8, F18, and dead\_doubleacute

! The "F9" key generates F9, F19, and dead\_cedilla

! The "F10" key generates F10, F20, and dead\_ogonek

! The "F11" key generates F11, F21, dead\_diaeresis, and dead\_circumflex

! The "F12" key generates F12, F22, dead\_abovering, and dead\_doubleacute

! The "Print Screen" key generates Print and Execute

! The "Scroll Lock" key generates ISO\_Next\_Group, and the Mod5 modifier

! The "`" key generates what you see + semicolon and dead diaeresis

! The "! 1" key generates 1, exclam, plus, 1 (the last one is with shift)

! The "@ 2" key generates 2, at, lcaron, and 2

! The "# 3" key generates 3, numbersign, scaron, and 3

! The "\$ 4" key generates 4, dollar, ccaron, and 4

! The "% 5" key generates 5, percent, tcaron, and 5

### 2.7. The standard ISO8859–2 definitions in the Xmodmap file

## How to setup international keyboard in X Window with Xmodmap and XKB

! The "^ 6" key generates 6, asciicircum, zcaron, and 6

! The "& 7" key generates 7, ampersand, yacute, and 7

! The "\* 8" key generates 8, asterisk, aacute, and 8

! The "( 9" key generates 9, parenleft, iacute, and 9

! The ") 0" key generates 0, parenright, eacute, and 0

! The "+ =" key generates equal, plus, dead\_acute, and dead\_caron

! The "Num Lock" key generates Num\_Lock and Pointer\_EnableKeys, and the Mod2 modifier

! The "Tab" key generates Tab and ISO\_Left\_Tab

! The "Q" key generates q and Q

! The "W" key generates w and W

! The "E" key generates e and E

! The "R" key generates r and R

! The "T" key generates t and T

! The "Y" key generates y and Y

! The "U" key generates u and U

! The "I" key generates i and I

! The "O" key generates o and O

! The "P" key generates p and P

! The "7 Home" key generates KP\_Home and KP\_7

! The "8 UpArrow" key generates KP\_Up and KP\_8

! The "9 Pg Up" key generates KP\_Prior and KP\_9

! The "Caps Lock" key generates Caps\_Lock, and has no modifiers

! The "A" key generates a and A

! The "S" key generates s and S

! The "D" key generates d and D

! The "G" key generates g and G

## How to setup international keyboard in X Window with Xmodmap and XKB

## 3. How this Xmodmap solution works on various systems

### 3.1. SuSE 6.4 and 7.0

#### 3.1.1. SuSE 7.0 with XFree86 version 3.3.6 and KDE 2.0 (this also applies to SuSE 6.4)

No LANG=language statement is necessary in your bash\_profile. You may use the Xmodmap file with standard ISO8859-2 keycode definitions, the above .Xmodmap file, (not "threequarters" but "scaron", etc.). Unfortunately, although you may immediately start writing with ISO8859-2 keycodes, the dead keys are not working properly and export LANG=language does not work here in order to make these dead keys work. There's also some bug with fonts or something – KDE 2.0 (or older XFree does not properly handle ISO8859-2 fonts together with Xmodmap. Old kedit, newest GNOME's gedit and StarOffice 5.2 work well (after applying the above script for StarOffice 5.2).

After copying the Compose file from /usr/X11R6/lib/X11/locale/iso8859-2/ to the /usr/X11R6/lib/X11/locale/iso8859-1/, you may start elegantly working with dead keys. This was also tested on StarOffice 5.2. The FontPath must be in /etc/XF86Config, not in /etc/X11/Xf86Config.

---

### 3.2. SuSE 7.0 with Xfree86 version 3.3.6 and KDE 1.x

Same as above.

---

### 3.3. Mandrake Linux 7.2

#### 3.3.1. Mandrake Linux 7.2 – works as it should

Yes, it works as it should – I used the "kcmshell Personalization/kcmlayout", command, which is in the menu in Configuration > KDE > Personalization > keyboard layout and after just putting the LANG=language statement in my .bash\_profile, StarOffice worked immediately (with ISO8859-2 fonts added to its directory) and I only switched the keyboards. I chose Czechoslovakian as the second language and could write in Czech with ISO8859-2 characters on my screen. (I used the script for putting the ISO8859-2 fonts for StarOffice). Unfortunately, the KDE 2.0 kedit could not visualize the ISO8859-2 fonts and after switching the keyboard and selecting ISO8859-2 charset I saw this: ??????? instead of lcaron, scaron, etc., but \*acute symbols (uacute, aacute, etc.) displayed well.

The maps in /usr/X11R6/lib/X11/xkb/symbols can be modified on the fly, while in X; you only have to switch keyboards from the panel (click on a flag icon). You can edit those maps and modify them for your choice. After changing some Czech definitions to Slovak, StarOffice displayed them well.

---

### 3.3.2. Mandrake Linux 7.2 with XFree86 version 3.3.6

Apply the standard .Xmodmap keycodes (scaron, lcaron, not "threequarters" or "mu", etc.) and issue the command: "xmodmap /.Xmodmap" and you may work by switching the keyboards by pressing Scroll Lock (if you use my Xmodmap file; if you use other Xmodmap file, try right Alt or whatever that is defined in the Xmodmap file).

The FontPath statement in /etc/X11/XF86Config and /etc/X11/XF86Config does not have to be changed:

```
FontPath "unix/:1"
```

The XFree86 reads automatically your fonts, but I put the ISO8859-2 fonts to /usr/share/fonts directory (same as in RedHat). Surprisingly, you do not have to copy the ../ISO8859-2/Compose file to ../ISO8859-1 directory and dead keys work nice.

---

### 3.4. Mandrake 8.1

This distribution works well as it should. In KDE, you must open the menu: Start > Preferences > Personalization > Country and Language, where you will change CHARSET from ISO8859-1 to ISO8859-2 (or ISO8859-X for any other language of your choice). Then you may either select a keyboard layout – Peripherals, Keyboard (Slovak is included with dozens of other keyboard XKB maps) from the menu: Start > Configuration > KDE > Personalisation > Peripherals > Keyboard, or you may choose my Standard Xmodmap solution. No other files require editing. That's great! Alternatively, you can set your keyboard with setxkbmap command (see section FreeBSD 4.4).

---

### 3.5. RedHat 5.1, 5.2, 6.0, 6.1 and 6.2 (XFree86 3.3.6 and older)

No LANG=language statement is necessary in your bash\_profile. Here the "experimental" .Xmodmap solution works ("mu" instead of "lcaron", etc.) and you must copy the Compose file from ../ISO8859-2 to ISO8859-1 directory in order for dead keys to work. There is only one XF86Config file in /etc/X11 and its FontPath should be the same as in SuSE 7.0 above.

---

### 3.6. RedHat 7.2

Same as Mandrake 8.1.

---

### 3.7. FreeBSD 3.1 and 3.2

Same as with RedHat 5.1, 5.2, 6.0, 6.1, 6.2

---

## 3.8. FreeBSD 4.1

No LANG=language statement is necessary in your bash\_profile. But you must put this to /etc/profile:  
LANG=cs\_CZ.ISO\_8859-2; export LANG

FreeBSD 4.1, 4.2, 4.3, 4.4 does not use Slovak locale, so we must use the Czech one. It really does not matter. Here this depends on XFree86. Because the FreeBSD guys are too conservative about a newer software, they ship FreeBSD with older versions of XFree86. In FreeBSD 4.1 the experimental .Xmodmap solution works and you have to copy the ../ISO8859-2/Compose file to ../ISO8859-1 directory to make the dead keys work.

---

## 3.9. FreeBSD 4.4.

The Standard xmodmap solution works well. You must put this to /etc/profile:

```
LANG=cs_CZ.ISO_8859-2; export LANG
```

Yes, we will use the Czech locale for the Slovak language. Other languages require similar syntax, e.g.:  
LANG=it\_IT.ISO\_8859-1; export LANG

for the Italian language. Alternatively, you may use

```
setxkbmap si
```

as a command from an X Terminal for the Slovenian language

```
setxkbmap se
```

for Swedish

```
setxkbmap de
```

for German, etc.

## 5. Troubleshooting and some Xmodmap tips

### 5.1. Troubleshooting

Get the newest Linux distribution. Mandrake 8.1 or RedHat 7.2 work fantastically with regard to internationalization (which could not be said about the previous distributions). If locales are not installed, you must install them. The GNU C Library comes with a locale database, which you should have on your system. Upgrade your glibc. Troubleshooting of older versions of XFree or KDE is insignificant in my opinion, as the systems get better and better and people install newer versions.

Use the command:

```
locale -a
```

to see all the locales.

---

### 5.2. Tips

If you want to list the current keymap table, issue the command: `xmodmap -pk | more`

The `xkeycaps` program is a sort of graphical front-end for `xmodmap`. Start it and see which numbers mean which keycode.

To make the mouse buttons left-handed, use a command: `xmodmap -e "pointer = 3 2 1"`

To remove the CapsLock and change it to a control key, write this in your Xmodmap file:

```
remove Lock = Caps_Lock keysym Caps_Lock = Control_L add Control = Control_L
```

---
